Mateno[®] Complete

HERBICIDE

**ACTIVE CONSTITUENT: 400 g/L ACLONIFEN
100 g/L PYROXASULFONE
66 g/L DIFLUFENICAN**

GROUP	32	15	12	HERBICIDE
--------------	-----------	-----------	-----------	------------------

For the pre-emergence or post-emergence control or suppression of various grass and broadleaf weeds in wheat (not durum wheat) and barley as specified in the DIRECTIONS FOR USE table.

DIRECTIONS FOR USE

RESTRAINTS

- DO NOT** apply to wheat beyond crop stage Z23
- DO NOT** plant durum wheat (*Triticum durum*) for 21 months after the application of Mateno Complete (refer to Crop Rotation Recommendations for further advice).
- DO NOT** use disc seeding systems to sow barley if Mateno Complete has been used as an IBS application.
- DO NOT** apply to waterlogged soil.
- DO NOT** apply more than one application of Mateno Complete per crop, growing season or calendar year.
- DO NOT** apply Mateno Complete and another pyroxasulfone containing product e.g. Sakura[®] WG, Sakura Flow in the same crop and growing season.
- DO NOT** allow first irrigation tailwater from land treated with Mateno Complete to enter aquatic and wetland areas including aquacultural ponds, surface streams and rivers.
- DO NOT** apply if heavy rain has been forecast within 3 days.
- DO NOT** irrigate to the point of runoff for at least 3 days after application.
- DO NOT** apply by aircraft

SPRAY DRIFT RESTRAINTS

- Specific definitions for terms used in this section of the label can be found at apvma.gov.au/spraydrift.
- DO NOT** allow bystanders to come into contact with the spray cloud.
 - DO NOT** apply in a manner that may cause an unacceptable impact to native vegetation, agricultural crops, landscaped gardens and aquaculture production, or cause contamination of plant or livestock commodities, outside the application site from spray drift. The buffer zones in the buffer zone table below provide guidance but may not be sufficient in all situations. Wherever possible, correctly use application equipment designed to reduce spray drift and apply when the wind direction is away from these sensitive areas.
 - DO NOT** apply unless the wind speed is between 3 and 20 kilometres per hour at the application site during the time of application.
 - DO NOT** apply if there are hazardous surface temperature inversion conditions present at the application site during the time of application. Surface temperature inversion conditions exist most evenings one to two hours before sunset and persist until one to two hours after sunrise.
 - DO NOT** Apply by boom sprayer unless the following are met:
 - Spray droplets not smaller than **MEDIUM** spray droplet size category
 - Minimum distances between the application site and downwind sensitive areas are observed (see 'mandatory downwind buffer zones' in the table titled 'Buffer zones for boom sprayers' below).

Buffer zones for boom sprayers

Application rate	Boom height above the target canopy	Mandatory downwind buffer zones	
		Natural aquatic areas	Vegetation areas
Up to 1.0 L/ha	0.5 m or lower	150 metres	30 metres

DIRECTIONS FOR USE (For use in all States)

IBS APPLICATION			
CROP	WEED	RATE	CRITICAL COMMENTS
Wheat (not durum wheat)	Annual ryegrass (<i>Lolium rigidum</i>), barley grass (<i>Hordeum leporinum</i>), silver grass (<i>Vulpia bromoides</i> , <i>Vulpia myuros</i>), toad rush (<i>Juncus bufonius</i>)	0.75-1.0 L/ha	Use the higher rate where a higher level of control is required (e.g. higher weed density expected or soils prone to leaching) or where a longer period of residual control is required. Apply pre-sowing onto uncultivated soil and incorporate by sowing (IBS. Avoid throwing treated soil into adjacent crop rows, leaving furrows open or shallow seed depth when sowing. (refer to Incorporation by Sowing in GENERAL INSTRUCTIONS). To reduce the risk of crop effects, refer to Crop Safety in GENERAL INSTRUCTIONS . For best results apply IBS just before sowing (refer to Interval between Application and Incorporation by Sowing in GENERAL INSTRUCTIONS). <i>Cultivation:</i> Grass weed control is optimised when weed seeds are present on, or very close to, the soil surface at the time of application. Apply directly to uncultivated soil. Weed control may be greatly reduced where grass weed seeds have been buried by cultivation prior to sowing.
	Annual phalaris or paradoxa grass (<i>Phalaris paradoxa</i> only), Suppression* of: great brome (<i>Bromus diandrus</i>) and wild oats (<i>Avena fatua</i>) *Refer Suppression of great brome and wild oats in GENERAL INSTRUCTIONS for further details Suppression of capeweed (<i>Arctotheca calendula</i>)	1.0 L/ha	<i>Ground cover:</i> Stubble, plant residue, large clods or other impediments to good soil contact can adversely affect weed control, particularly where ground cover exceeds 50%. <i>Rainfall soon after application:</i> <ul style="list-style-type: none"> • Weed control may be adversely affect by insufficient rainfall within 7 to 10 days after application. Adequate rainfall is necessary to facilitate uptake of the product by the germinating weed seeds, however the quantity of rainfall required will depend on many factors including stubble load and other impediments, soil type, the existing soil moisture at sowing, the pattern of rainfall and other considerations. • In soils prone to leaching, rainfall which is sufficiently heavy to cause movement of the herbicide out of the weed seed zone may lead to reduced weed control. (Refer to Application before Incorporation by Sowing, Incorporation by Sowing and Soil Type in GENERAL INSTRUCTIONS .) Where a suppression level of weed control is provided a follow up application with a suitable post-emergent herbicide is generally required to control remaining plants.

IBS APPLICATION			
CROP	WEED	RATE	CRITICAL COMMENTS
Barley	Annual ryegrass (<i>Lolium rigidum</i>), barley grass (<i>Hordeum leporinum</i>), silver grass (<i>Vulpia bromoides</i> , <i>Vulpia myuros</i>), toad rush (<i>Juncus bufonius</i>)	0.75 L/ha	<p>Apply only pre-sowing and incorporate by sowing (IBS) using knife points and press wheels onto uncultivated soil. Avoid throwing treated soil into adjacent crop rows, leaving furrows open or shallow seed depth when sowing. Mateno Complete Herbicide

Do not add an adjuvant to Mateno Complete when used alone EPE.

Do not use with seeding systems which leave the crop row open or with shallow soil coverage of the crop.

EPE APPLICATION – wheat only (not durum wheat)				
CROP	WEED	Weed stage	RATE	CRITICAL COMMENTS
Wheat (not durum wheat)	Suppression of annual ryegrass (<i>Lolium rigidum</i>), Suppression of barley grass (<i>Hordeum leporinum</i>)	Up to 2 leaf	1.0 L/ha	<p>Without an application of a registered pre-emergent annual ryegrass herbicide, Mateno Complete, applied early post-emergence (EPE), will only provide variable suppression of annual ryegrass and should not be relied on to control annual ryegrass.</p> <p>Apply an effective registered pre-emergent annual ryegrass herbicide before using Mateno Complete EPE for control of annual ryegrass.</p> <p>Use the higher rate where a higher level of control is required, or where high weed numbers exist (e.g. ryegrass > 100 plants/m²) or where a longer period of residual control is required.</p> <p>Rainfall before and soon after application.</p> <ul style="list-style-type: none"> • Weed control may be adversely affected where weeds are not actively growing due to insufficient rainfall before application. • Grass weed control may be adversely affected by insufficient rainfall within 7 to 10 days after application. Adequate rainfall is necessary to facilitate uptake of the product from the soil by the young weeds (including weeds in the process of germinating and/or weeds yet to emerge), however the quantity of rainfall required will depend on many factors including stubble load, soil type, the existing soil moisture at sowing, the pattern of rainfall and other considerations. • In soils prone to leaching, rainfall which is sufficiently heavy to cause movement of the herbicide out of the weed root zone (and the zone where weed seeds may still be germinating) may lead to reduced weed control. Refer to EPE efficacy in GENERAL INSTRUCTIONS
	Silver grass (<i>Vulpia bromoides</i> , <i>Vulpia myuros</i>)	Up to 2 leaf	0.75 to 1.0 L/ha	
	Toad rush (<i>Juncus bufonius</i>)	Up to 2 leaf	0.75 L/ha	
		Up to 3 leaf	1.0 L/ha	
	Annual ryegrass (<i>Lolium rigidum</i>),	Up to 3 leaf	0.75 to 1.0 L/ha (following an effective pre-emergent annual ryegrass herbicide)	
Capeweed (<i>Arctotheca calendula</i>), wild radish (<i>Raphanus raphanistrum</i>)	Up to 3 leaf	1.0 L/ha alone, or with MCPA LVE 0.44 L/ha	<p>In cold conditions, or where spray coverage is compromised, add MCPA LVE once the crop has reached the required growth stage (as recommended on the MCPA LVE label).</p> <p>A follow up application of a suitable post emergent herbicide may be required to control remaining annual broad leaf weeds.</p>	

EPE APPLICATION – wheat only (not durum wheat)				
CROP	WEED	Weed stage	RATE	CRITICAL COMMENTS
	Suppression of doublegee/spiny emex (<i>Emex australis</i>)	Cotyledon to 2 leaf	1.0 L/ha	A follow up application of a suitable post emergent herbicide may be required to control remaining annual broad leaf weeds.
	Doublegee/spiny emex (<i>Emex australis</i>)	Cotyledon to 4 leaf	1.0 L/ha + 600 g/kg metsulfuron methyl at 5 g/ha + BS1000 0.1% v/v	Refer to the tank mix partner label for directions on crop stage.
	Prickly lettuce (<i>Lactuca serriola</i>)	Up to 2 leaf	0.75-1.0 L/ha	Use the higher rate where a higher level of control is required (e.g. higher weed density expected or soils prone to leaching).

NOT TO BE USED FOR ANY PURPOSE, OR IN ANY MANNER, CONTRARY TO THIS LABEL UNLESS AUTHORISED UNDER APPROPRIATE LEGISLATION.

WITHHOLDING PERIODS

Harvest:

All crops: NOT REQUIRED WHEN USED AS DIRECTED

Grazing/Stockfood:

All crops: DO NOT GRAZE OR CUT FOR STOCKFOOD FOR 6 WEEKS AFTER APPLICATION

GENERAL INSTRUCTIONS

Mateno Complete Herbicide is primarily a residual, soil applied, pre-emergent herbicide, also with early post emergence activity. Pyroxasulfone is absorbed by the roots and to a lesser extent the shoots of germinating weeds. Aclonifen and diflufenican are foliar active herbicides with less soil activity than pyroxasulfone. Activity on grass weeds for pre-emergent and early post emergent application is primarily through root uptake, as well as some foliar uptake for early post emergent application. Activity on broad leaf weeds from early post emergence application is primarily via foliar activity. Weed control from pre-emergent application is optimised when Mateno Complete is applied evenly to soil just prior to incorporation by sowing and there is sufficient rainfall soon after sowing to ensure uptake of the herbicide by germinating weeds. Weed control from early post emergent application is optimised when Mateno Complete is applied evenly to the soil and young actively growing weeds and there is sufficient rainfall soon after application to ensure uptake of the herbicide by the emerged weeds.

Application before Incorporation by Sowing

Weeds germinating from depth, weeds just about to emerge or germinated and emerged weeds at sowing that are not controlled by an effective knockdown herbicide at sowing may not be controlled by Mateno Complete.

Ensure complete and even spray coverage of soil is achieved. Poor spray coverage may result from application to ridged or excessively cloddy soil or in situations of high stubble, plant residue or other ground cover. A significant reduction in weed control may result where stubble, plant residue or other ground cover exceeds 50%, and in situations where a 'cold' or incomplete burn of stubble results in a mass of material which can act as a physical barrier between the herbicide and germinating weeds – this can be exacerbated in header trails where there may be greater weed seed numbers and higher levels of plant residue. Weed control can be particularly affected where Mateno Complete is applied to a barrier of stubble, plant residue or other ground cover and there is insufficient following rainfall to move the herbicide to the seed and root zone of germinating weeds.

Interval between Application and Incorporation by Sowing

To optimise weed control, sow as soon as practicable after the application of Mateno Complete and no later than 7 days after application.

Incorporation by Sowing

When applied prior to sowing, Mateno Complete should be incorporated by sowing using knife points and press wheels or disc seeding systems (not barley) that are set up to ensure sufficient separation of the crop seed from treated soil, stubble and weeds (see **Crop Safety** section). Ensure treated soil is not thrown into adjacent furrows. When incorporation is by knife point and press wheels, weeds germinating in or near the seed row (edge of the furrow) may not be controlled. Knife points and press wheel seeding systems are generally safer to the crop than disc seeding systems as they tend to move more treated soil, stubble and weeds away from the crop row and cover the treated soil surface between the crop rows with soil, reducing the risk of Mateno Complete moving and concentrating in the crop row following rainfall. Disc seeding systems that result in minimal soil disturbance and allow the concentration of herbicide in the seeding slot following rainfall will substantially increase the risk of crop damage and should be avoided.

Soil Type

Grass weed control is often more reliable in loam to clay soils, where there is enough rainfall within 7 to 10 days after application to facilitate the uptake of the herbicide by germinating weed seeds. Weed control may be reduced in soils prone to leaching where rainfall after application and sowing is sufficiently heavy to cause movement of the herbicide out of the weed seed zone. Weed control may also be adversely affected by the presence of water repellent soils.

Suppression of great brome and wild oats

Mateno Complete is most effective when grass weed seeds are present on or very close to the soil surface with good soil moisture at the time of application. For this reason, it is recommended that IBS Mateno Complete is applied to uncultivated soil. As the depth of weed seeds increases, control from Mateno Complete tends to decrease. It is rare that all great brome and wild oat seeds will be on the soil surface at the time of Mateno Complete application, especially considering that these seeds may remain viable in the soil for several seasons. Plants may germinate from seeds buried by the sowing operation, by livestock or by weed seed self-burial mechanisms particularly in some soil types (e.g. cracking clays and sand). **Therefore, only partial control or suppression of the great brome or wild oat population should generally be expected.** In these situations, a follow up application with a suitable post-emergent herbicide will generally be required to control remaining plants.

Early Post Emergence (EPE) Application

Annual grass weeds

For early post emergent grass weed control, Mateno Complete should only be used following a pre-sowing application of an effective pre-emergent herbicide relevant for the weed/s being targeted. For example, for the control of up to 3 leaf annual ryegrass in established wheat, Mateno Complete may be applied following the pre-sowing application of trifluralin, Avadex Xtra, Arcade or Boxer Gold IBS. Check with Bayer Crop Science for additional herbicides tested. For reliable control, weeds should be actively growing at the time of application and there should be sufficient rainfall soon after application for the movement of the product into the weed root zone. Grass weed control on sandy soils may be adversely affected where rainfall after application is sufficiently heavy to cause the movement of the herbicide through and out of the weed seed zone.

There may be increased risk of crop damage from application following heavy rainfall in disc sown crops where rainfall is sufficiently heavy to move cause a concentration of herbicide in the crop sowing slot (see **Crop Safety** section).

Annual broad leaf weeds

Ensure complete and even coverage of weeds is achieved and that weeds are actively growing at the time of application. Complete coverage may be adversely affected by shading from the crop, weeds (due to high weed density) and stubble. Mateno Complete should be applied onto young annual broad leaf weeds as directed in the **DIRECTIONS FOR USE** table. The addition of a compatible herbicide (refer to the **Compatibility** section of this label for other compatible products), once the crop has reached the correct stage according to the label of the added compatible product, may improve control, particularly in high weed density situations where shading occurs. Where complete weed control is not achieved, a follow up application using a suitable herbicide may be required to control remaining annual broad leaf weeds.

Crop Safety

General crop safety

Mateno Complete shows good crop selectivity when used as directed. The following directions will help minimise the risk of crop effects.

- Do not plant durum wheat after the application of Mateno Complete as it may be severely damaged. Refer to **Crop Rotation Recommendations** for further advice.

- Use a seeding system that does not throw treated soil into the adjacent crop row and does not result in treated stubble or weeds close to the germinating crop seed or emerging crop seedling roots. Seeding systems that do not sufficiently cover the seeding row with untreated soil may result in increased crop effects.
- Do not use a combination of both press wheels and a covering device such as harrows or chains when sowing.
- Ensure good crop nutrition and disease control.
- Ensure good control of soil diseases which affect root growth.

The potential for crop damage is increased when there is substantial rainfall after the application of Mateno Complete, especially where this leads to temporary waterlogging. Situations which lead to concentration of herbicide in the planting row, or movement of herbicide to the depth of the crop seed, may also increase the potential for crop damage. This includes the following scenarios;

- Where deep furrows are formed by the sowing operation, soil movement into the crop row may occur due to wind or heavy rainfall or irrigation soon after sowing resulting in concentration of herbicide in the crop row.
- Where the treated soil surface is not covered by soil during the seeding operation (typical of some disc seeding systems) and heavy rainfall results in the movement and concentration of herbicide in the crop row.
- Where soil has a potential for leaching and rainfall moves the herbicide into the crop root zone (typical of some disc seeding systems in lighter soils).
- Where treated stubble is incorporated near the crop seed by the seeding system.
- Where open sowing slots are present at the time of early post emergent application and rainfall results in the movement and concentration of herbicide in the crop row.
- Where shallow sowing results in a concentration of herbicide in the crop seed zone.
- Where soil has a high potential for leaching, heavy rainfall or irrigation between application and crop emergence may result in movement of herbicide into the crop seed zone.

Other circumstances which may increase the potential for crop damage include;

- Where Mateno Complete is applied in tank mixes with other herbicides,
- Where crop vigour is reduced due to factors such as frosts, insect attack, inadequate nutrition or crop disease,
- When weather damaged seed is used and/or with the use of some fungicide seed treatments especially in conjunction with crop varieties with short coleoptile length.

A combination of individual factors which increase the potential for crop damage may increase the extent of crop damage.

Adjuvants and EPE applied crop safety

Tank mixing adjuvant when applying Mateno Complete can increase crop effects. Do not add an adjuvant when applying Mateno Complete alone EPE.

Check the compatibility section of this label when tank mixing with a partner herbicide that recommends an adjuvant.

IMPORTANT CROP SAFETY INFORMATION SPECIFIC TO USE OF MATENO COMPLETE IN BARLEY

Barley is less tolerant than wheat to Mateno Complete. While in most cases barley crops will be unaffected or minimally affected by Mateno Complete, there may occasionally be reduced emergence and, in some situations, severe reductions in barley crop growth which may persist for the length of the growing season. Further, where severe crop growth effects from the use of Mateno Complete in barley are evident, yield reductions may occur, depending on whether such crop growth effects have been compensated for by reduced competition through effective weed control.

Unfavourable crop effects tend to be greatest when either a high-intensity rainfall event follows soon after the sowing of barley, causing treated soil to move into the crop row or soaking rainfall during the early stage of the growing season causes the movement of product into the crop seed zone.

The following measures may reduce the movement of product into the crop seed zone:

- Sow barley as soon as practicable after the application of Mateno Complete.
- Incorporation should only be by knife points and press wheels when sowing barley; do not use harrows or other covering devices (e.g. chains).
- Do not use Mateno Complete where barley is planted with disc seeding systems.
- Avoid using Mateno Complete with barley in a dry seeding situation.
- Avoid sowing situations that result in stubble drag or any other sowing practices that result in treated soil moving into the crop rows.

- Avoid sowing practices and soil types that may result in furrow collapse and subsequent movement of chemical into the crop rows.

Crop effects may be exacerbated by factors that inhibit crop root growth such as root disease, environmental stress (e.g. waterlogging), poor nutrition, soil compaction, presence of a hard pan, poor seed quality, etc.

The following measures may help reduce the extent of crop damage to barley sown following the application of Mateno Complete. However, since intense or soaking rainfall after sowing is the main cause of crop damage in barley, these recommendations cannot be relied upon to prevent serious crop effects:

- Avoid using Mateno Complete in soils prone to waterlogging.
- Do not apply Mateno Complete in conjunction with other pre-emergent herbicides prior to planting barley.
- Use good quality barley seed.
- Do not use barley seed treated with fungicide seed treatments that may shorten the coleoptile and/or delay emergence.

The potential benefits of using Mateno Complete in barley should to be assessed according to the particular circumstances and balanced against the risks outlined above. Always consult your Mateno Complete agent in relation to the appropriate use of Mateno Complete.

Mixing

Shake contents of container well, before using. Ensure sprayer and nozzle filters are completely clean and maintained before preparing the spray mixture. Continuous agitation is required during the full process of loading and mixing and until the end of the spraying process. Fill the spray tank to 70% full of water and, with the agitators in motion, add the correct amount of Mateno Complete directly to the spray tank. Complete filling the tank with agitators in motion. When other products are to be applied in combination with Mateno Complete, always add any dry products (WP, WG formulations) to the tank slowly first, allowing at least 10 minutes of constant agitation for thorough dispersion, before adding the correct amount of Mateno Complete to the spray tank. Allow enough time under constant agitation (at least 10 minutes) for Mateno Complete to thoroughly disperse before adding subsequent tank-mix products (e.g. EC or SL formulations) to the tank. Apply the spray liquid immediately after mixing the product(s) into the spray tank. Do not allow the spray mixture to remain in the spray equipment over night and/or without constant agitation. Cleaning of the sprayer immediately after the application is very important (see sprayer clean-up).

Application Equipment

Ground Sprayers – Standard boom sprayers only are recommended and must be fitted with by-pass or mechanical agitation. The use of coarse mesh in-line and nozzle filters is recommended. Do not use nozzle filters finer than 50 mesh. It is recommended that 70 to 100 L water/ha is applied with spray minimum MEDIUM droplet size category; refer spray drift restraints section of this label. In some situations (e.g. high stubble loads) high water volumes may give higher levels of weed control.

Aircraft – DO NOT apply Mateno Complete by aircraft.

Sprayer clean-up

Following the use of Mateno Complete, the spraying equipment should be thoroughly cleaned before it is used for application of other products. Cleaning should occur immediately following the last application of Mateno Complete or before the sprayer is not used for several hours. The spray unit should first be completely emptied by spraying. Then fill the empty sprayer 1/3 full of water to dilute the remaining amount. Then move the sprayer so that all walls are rinsed. Dispose of water (rinsate) in accordance with State regulations. Check the filter and nozzle for residues and clean them if necessary. The sprayer, including all filters and lines, should be thoroughly rinsed with water, to remove all traces of product.

Ensure that the sprayer clean-up is carried out in an area that is clear of waterways, desirable vegetation and tree roots. If using Mateno Complete with a tank-mix partner, refer to the sprayer clean-up instructions for the other product, which may be more rigorous than those for Mateno Complete.

Crop Rotation Recommendations

Mateno Complete breaks down by microbial degradation, which is favoured by warm, moist aerobic soil. Minimum recropping intervals (months after Mateno Complete application) have been established for Mateno Complete to minimise the risk of damage to following crops (see table below). However, environmental and agronomic factors make it impossible to eliminate all risk and therefore the potential for damage to following crops exists.

Rainfall of less than the minimum interim rainfall required (see table below) may result in extended recropping intervals. Interim rainfall is the total rainfall between the application of Mateno Complete and planting of the following crop. For recropping with winter crops, where a minimum of 250 mm of interim rainfall is required, if rain from application to the end of spring is less than 125 mm and isolated heavy summer and autumn falls and break rains are required to achieve the 250 mm interim rainfall, then extended recropping intervals may apply.

Crops	Recropping recommendation for a maximum Mateno Complete at 1.0 L/ha in any growing season or calendar year	
	Minimum recropping interval	Minimum interim rainfall
Wheat (not durum wheat)	0 months	0 mm
Cotton, maize, mung beans, sorghum, soybeans and sunflowers	5 months ¹	150 mm
Barley	0 or 9 months ²	0 or 250 mm
Canola, chickpeas, faba beans, field peas, lentils, lupins, vetch and subterranean clover	9 months ³	250 mm
Durum wheat, lucerne, oats, medics	21 months ⁴	500 mm

¹ For cotton, maize, mung beans, sorghum, soybeans and sunflowers there may occasionally be some crop stunting or biomass reduction, but the crop growth improves as the season progresses and no yield reductions have been measured.

² Barley can be sown immediately after the application of Mateno Complete, at 0.75 L/ha only, where Mateno Complete has not already been incorporated. However, where Mateno Complete has been incorporated into the soil, for example, by a previous sowing operation, barley should not be sown for at least 9 months after the application of Mateno Complete.

Avoid applying Mateno Complete in barley where a product containing pyroxasulfone (e.g. Mateno Complete, Sakura 480 SC or Sakura 850 WG) has been applied the previous year as crop damage may be more severe (pronounced, exacerbated) in some circumstances.

³ For canola, chickpeas, subterranean clover, faba beans, field peas, lentils, lupins and vetch sown the year after the application of Mateno Complete there may occasionally be some crop stunting or biomass reduction, but the crop growth improves in spring and no yield reductions have been measured.

⁴ For oats, durum wheat, lucerne and medics there may occasionally be some crop stunting or biomass reduction, but the crop growth improves as the season progresses and no yield reductions have been measured.

Avoid overlapping the boom spraying when Mateno Complete is applied.

RESISTANCE WARNING

GROUP	32	15	12	HERBICIDE
-------	----	----	----	-----------

Mateno Complete is a member of three herbicide groups: Aclonifen is a member of the diphenyl ether group of herbicides and acts by inhibiting solanesyl diphosphate. For weed resistance management aclonifen is a Group 32 herbicide. Diflufenican is a member of the phenyl ethera group of herbicides and acts by inhibiting carotenoid biosynthesis via inhibiting phytoene desaturase. For weed resistance management diflufenican is a Group 12 herbicide. Pyroxasulfone is a member of the isoxazoline group of herbicides and is an inhibitor of very long chain fatty acids (VLCFA inhibitors). For weed resistance management pyroxasulfone is a Group 15 herbicide. Some naturally-occurring weed biotypes resistant to Mateno Complete, and other Group 12, 15 and 32 herbicides, may exist through normal genetic variability in any weed population. These resistant individuals can eventually dominate the weed population if these herbicides are used repeatedly. These resistant weeds will not be controlled by Mateno Complete or

other Group 12, 15 or 32 herbicide.

Do not rely exclusively on Mateno Complete for weed control. Use as part of an integrated weed management program involving herbicides with other modes of action and nonchemical methods of control. CropLife Australia resistance management strategies are available from your local agricultural chemical supplier or at the CropLife Australia website (www.croplifeaustralia.org.au). Refer to these strategies for details of how to manage the build-up of resistant weeds.

Since occurrence of resistant weeds is difficult to detect prior to use Bayer CropScience Pty Ltd accepts no liability for any losses that may result from the failure of Mateno Complete to control resistant weeds.

COMPATIBILITY

Crop damage seen in adverse conditions, particularly wet or waterlogged conditions (refer **Crop Safety** above) may be exacerbated when Mateno Complete is used in conjunction with other crop protection products.

Always refer to the adjuvant, application timings, crop tolerance, plant back restrictions, rate recommendations and other directions for use on the label of the tank mix partner.

Refer to **Mixing** section above for advice on preparing tank mixtures with Mateno Complete.

Biologically compatible products are listed in the table below. Products are considered biologically compatible when they do not cause significant detrimental effect (antagonism) on the efficacy or crop selectivity of the products they are applied with. Always check biological and physical compatibility before mixing products in the same spray tank. For advice on physical compatibilities (or biological compatibilities not listed below), contact Bayer Crop Science.

Situation		Biologically compatible products
IBS For application prior to planting wheat or barley		
Knockdown herbicides ^{1,2}	Mateno Complete is biologically compatible with any one of the following knockdown herbicides;	Spray.Seed [®] ¹ , Gramoxone [®] ¹ and glyphosate ² .
Glyphosate plus other herbicides ^{3,4}	Mateno Complete is biologically compatible with mixtures of glyphosate ² with any one of the following herbicides;	Ally [®] /Associate [®] , Estercide [®] Xtra ⁵ 680, Logran [®] B-Power and Sharpen ^{®5} .
IBS herbicides ^{3,4}	Mateno Complete is biologically compatible with any one of the following IBS/pre emergence herbicides when used in wheat;	Ally/Associate, Arcade [®] , Avadex Xtra ⁵ , Diuron 900 WG to 550 g/ha (wheat), Estercide Xtra ⁵ 680 to 0.8 L/ha, Hammer [®] /Nail [®] , Sharpen ⁵ , Striker [®] ⁵ and trifluralin.
IBS insecticides	Mateno Complete is biologically compatible with any one of the following insecticides when used IBS/pre emergence in wheat	Alpha Duo, Lorsban [®] 500 EC ⁶ , Trojan [®] .
EPE For application Early Post Emergence in wheat		
EPE herbicides ^{3,4}	Mateno Complete is biologically compatible with any one of the following EPE/post emergence herbicides when used in wheat;	Ally to 5 g/ha, Archer [®] /Lontrel [®] Advanced, Axial [®] , MCPA 570 LVE to 440 mL/ha, and Precept [®] .
EPE insecticides ⁴	Mateno Complete is biologically compatible with any one of the following EPE/post emergence insecticides when used in wheat;	Alpha Duo, Lorsban 500 EC, Trojan.

¹Mixtures with products containing paraquat require particular attention to the mixing instructions above, including ongoing agitation to ensure Mateno Complete remains in suspension in the spray tank.

²The speed of control may occasionally be reduced when Mateno Complete is mixed with glyphosate. The final control from Roundup is not reduced and may be improved by the addition of Mateno Complete. Any reduction caused by mixing Mateno Complete with the Roundup products to the speed of weed control can be alleviated by the addition of Liase[®] (liquid ammonium sulphate) or Collide[®] 700 adjuvants. Extra care should be taken when mixing Mateno Complete with some glyphosate products. For information on the physical compatibility of Mateno Complete with glyphosate products refer to the mixing guide using QR code on product container or contact Bayer Crop Science.

³Refer to the compatible products label, use a wetting agent such as BS1000 where the compatible product recommends an oil or a wetting agent.

⁴ there may occasionally be transient increase in crop effects.

⁵ extreme care should be taken when mixing Mateno Complete with Avadex Xtra, Estercide Xtra 680, Striker or Sharpen. For information on the physical compatibility of Mateno Complete with Avadex Xtra, Estercide Xtra 680, Striker or Sharpen refer to the mixing guide using the QR code on product container or contact Bayer Crop Science.

⁶ there may occasionally be a reduction in weed control.

PROTECTION OF WILDLIFE, FISH, CRUSTACEANS AND ENVIRONMENT

Very toxic to aquatic life. DO NOT contaminate wetlands or watercourses with this product or used containers.

PROTECTION OF CROP, NATIVE AND OTHER NON-TARGET PLANTS

Toxic to flora. DO NOT apply or drain or flush equipment on or near native or non-target trees or other plants or on areas where their roots may extend or in locations where the chemical may be washed or moved into contact with their roots.

STORAGE AND DISPOSAL

Store in the closed, original container in a dry, cool, well-ventilated area out of direct sunlight.

Non-Returnable Containers

Triple rinse containers before disposal. Add rinsings to spray tank. Do not dispose of undiluted chemicals on site. If recycling, replace cap and return clean containers to recycler or designated collection point. If not recycling, break, crush, or puncture and deliver empty packaging to an approved waste management facility. If an approved waste management facility is not available bury the empty container 500 mm below the surface in a disposal pit specifically marked and set up for this purpose clear of waterways, desirable vegetation and tree roots, in compliance with relevant Local, State or Territory government regulations. Do not burn empty containers or product. Do not re-use container for any other purpose.

Returnable Containers

If tamper evident seals are broken prior to initial use then the integrity of the contents cannot be assured. Empty product as required into application equipment. Do not attempt to breach the valve system or filling point, or contaminate the container with water or other products. Ensure that equipment used in transfer of the product is disconnected, triple rinsed with clean water and drained after each use. when the container is empty, close all caps and valves and return the container to the point of purchase.

SAFETY DIRECTIONS

When preparing spray and using the prepared spray, wear cotton overalls buttoned to the neck and wrist (or equivalent clothing) and elbow length chemical resistant gloves. Wash hands after use. After each day's use, wash gloves and contaminated clothing.

FIRST AID

If poisoning occurs, contact a doctor or Poisons Information Centre. Phone Australia 13 11 26; New Zealand 0800 764 766.

SAFETY DATA SHEET

Additional information is listed in the Safety Data Sheet, which can be obtained from www.crop.bayer.com.au.
